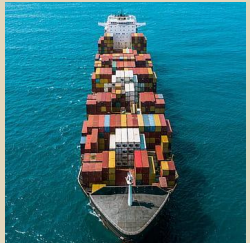
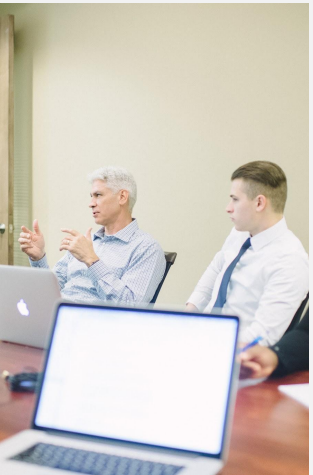
Milestone 3

Automated Supply Chain Analytics Pipeline



Problem Background

Management often struggles to gain a consolidated view of operations because data are stored in separate systems and reviewed independently. As the business expands, decision-making becomes difficult. Inventory shortages occur, logistics costs fluctuate without clear justification, and inefficient production is unnoticed. Therefore, leadership needs a centralized report to integrate operational and commercial metrics into a single and structured view.



Objective

This dashboard provides a data-driven decision making and improve overall operational efficiency. It will be used to optimize revenue, monitor cost efficiency, supply chain risk & diversification, analyze customer & market distribution, and operational planning.

Users

Main Users

Supply Chain Managers

Monitor supplier distribution, transportation cost, and route performance to minimize risk and optimize logistics decisions.

Operations Managers

Track manufacturing cost and lead time patterns to improve production planning and process standardization.

Finance Managers

Evaluate revenue drivers, cost structures, and margin impact.

Sales and Commercial Teams

Identify great products and customer segments to refine pricing and market targeting strategies.

Senior Management / Executives

View profitability, operational risk, and growth opportunities to guide strategic decision making.

Integrated Supply Chain & Revenue Performance Dashboard
